OCTOBER 30, 2001

SACRAMENTO, CALIFORNIA

MR. RAMIREZ: I think we're ready to start the program. And I'm sure if we happen to end a few minutes early, we won't have too many objections. So let's see if that's a possibility.

Hopefully people have had an opportunity to look at our displays and talk to some of our Resource experts that have been part of the relicensing process. It's a very complex process, I think people have discovered. We have done our best to make our way through the process, and hopefully you see evidence of that in the displays and in the answers to any questions you might have had for our Resource folks.

Okay. I think I know most of you out there, but for those that don't know me, my name is Rick Ramirez. I'm the Program Manager for the Oroville Relicensing Program. I've been with the Department approximately 25 years mainly on the power side of the house.

I will be giving you some brief introductions, and then I'll be turning it over to one of our featured speakers here, presenters, Mr. Tim Welch

1 with the Federal Energy Regulatory Commission. He
2 will explain the FERC perspective, and he'll explain
3 the context in which this scoping meeting is taking
4 place. I will then return to the podium and talk
5 specifically about our Oroville Program and share
6 with you how we are conducting the scoping process
7 and also let you know some of the issues that our
8 ongoing, Collaborative process has uncovered.

9 Now, I'm using some terms of art here, and Tim
10 Welch will explain in a little more detail exactly
11 what we mean by the Collaborative and Alternative
12 Licensing Procedures. And then after -- after Tim
13 and my presentation, then we'll turn the meeting over
14 to our facilitator, Ms. Patti Kroen, who will help
15 conduct the solicitation of comments that are an
16 important part of this process. And I believe we
17 have upwards of 10 to 15 speakers that have signed
18 up. So it will be very interesting to hear what
19 additional comments we receive.

20 For those of you that don't know, we did have
21 a public meeting last night in the city of Oroville
22 where we got some interesting input from community
23 representatives and others. We also had a site visit
24 that took place yesterday morning as well, all part
25 of our scoping process. So I hope -- I hope this

1 particular meeting will be as informative and useful
2 as the other meeting.

3 And with that, let me turn it over to Mr. Tim
4 Welch, who will, again, give you the FERC perspective
5 on scoping. And then I'll return with a DWR Oroville
6 facilities specific discussion. Thank you.

7 MR. WELCH: Thanks, Rick.

8 As Rick said, I'm Tim Welch. And on behalf of
9 the Federal Energy Regulatory Commission, I'd like to
10 welcome you to what's technically the FERC scoping
11 meeting. Now, typically we have our scoping meetings
12 much later in the process after the application is
13 filed. But with the advent of our new alternative
14 licensing process, we felt it made a lot more sense
15 to have scoping during the actual ALP itself because
16 it's our feeling that the ALP process is scoping.
17 And so it would make -- just, as I said, make more
18 sense for us to have this scoping meeting sort of at
19 this time. And the reason we have to have these
20 meetings is following the guidelines of the Council
21 for Environmental Quality.

22 So who are we? Who is FERC? We're the
23 Interstate Regulatory Authority, and we regulate in
24 five different areas: Electric power, natural gas,
25 and oil pipeline and, of course, the reason we're

1 here today is we regulate the non-federal
2 hydroelectric industry.

3 For those of you that don't know, the
4 Commission is made up of five different
5 commissioners. Right now we have four sitting
6 commissioners and one nominee that will be before the
7 Senate. And these five commissioners are all
8 appointed by the president. Our current chairman is
9 Pat Wood from Texas -- no surprise there -- who
10 recently became the chairman probably maybe two
11 months ago.

12 Now, within the Commission itself, I work as
13 part of the technical staff in the office of what's
14 called the Office of Energy Projects. And our office
15 specifically administers the non-federal hydropower
16 program, which sort of boils down to issuing and
17 reissuing licenses to operate hydroelectric projects
18 for 30 to 50 years.

19 We have two locations. I'm from the
20 headquarters, which is in Washington, D.C., which is
21 where most of our staff is located. However, we have
22 regional offices in New York, Atlanta, Chicago,
23 Portland and San Francisco. And those offices are
24 staffed primarily by our regional inspectors who are
25 part of our Dam Safety Program.

1 Now, within the Office of Energy Projects, we
2 have the Division of Environmental and Engineering
3 Review, which is our -- basically our licensing
4 technical staff of which I'm a part. I'm a fishery
5 biologist. We also employ engineers and recreation
6 specialists, archaeologists, a couple of economists,
7 geologists. So most of the technical group that
8 prepare the actual NEPA documents are within the
9 Environmental and Engineering Review.

10 Now, on the -- we also have a group that takes
11 care of the license after it's been issued, the
12 Hydropower Compliance and Administration Group. As I
13 mentioned earlier, we have our Dam Safety and
14 Inspections Program, and finally our gas group that
15 does NEPA documents for gas pipeline certificates.

16 So how is the public typically involved in the
17 licensing process? Well, the Federal Power Act has
18 provisions under Section 10A and 4E where it mandates
19 that FERC determines that a license be best adapted
20 to serve the public interest. So this is -- this is
21 the key thing for FERC. It's our goal to issue a
22 license that's within the public interest. Not
23 always an easy thing to do, but we -- but we're
24 hoping that our new alternative licensing process,
25 which this particular relicensing, 2100 is a part of,

1 will help us get to the public interest decision that
2 we need to meet. So within -- within the licensing
3 process, there's very -- there's quite a few
4 opportunities for public involvement.

5 So as Rick mentioned, for those of you that
6 don't know, the licensing process can be very
7 complex. And this is one of the big reasons, is that
8 it involves not only the Federal Power Act, but it
9 can involve many other acts of Congress all coming
10 together under the umbrella of licensing or
11 relicensing. The most prominent, of course, is NEPA,
12 which is the reason why we're doing our Environmental
13 Impact Statements and our Environmental Assessments.
14 The Clean Water Act plays a huge role with 401 Water
15 Quality Certificates that every project needs. The
16 Fish and Wildlife Coordination Act requires us to set
17 up our regulations so that we consult with the U.S.
18 Fish and Wildlife Service, the National Fishery
19 Service and state agencies, among others. And, of
20 course, something that's been playing a bigger and
21 bigger role in the last decade or so, the Endangered
22 Species Act. As more fish populations and
23 terrestrial populations are listed, when we take --
24 this is a federal action by FERC, which kicks -- goes
25 under Section 7 of the Endangered Species Act where

1 FERC has to consult. The National Historic
2 Preservation Act for culture resources. CZMA
3 sometimes comes into play as well as the Wild and
4 Scenic Rivers Act. So it can mean a lot of
5 coordination with a lot of other federal agencies.

6 So basically most applicants have two choices
7 when it comes time for their licenses to expire.
8 They can use what we term our traditional licensing
9 process, which is the one that's been in place for
10 quite a few years; and then our most recent process
11 we put together about five or six years ago, we call
12 the Alternative Licensing Process, some call the
13 Collaborative Process, and that's -- the ALP is what
14 DWR is following. So I'm going to talk a little bit
15 more about the Alternative Licensing Process and how
16 it differs from our traditional approach.

17 Now, here we represent our traditional
18 approach. This is a slide that I put together a
19 number of years ago that goes into a lot more detail
20 than this for our Outreach Program. And it just --
21 we thought it was a good way of presenting what we
22 call a living license. And I remember the first time
23 I presented our process in a circular manner,
24 regardless to say, I got a lot of strange looks from
25 a lot of the applicants in the office -- or in the

1 audience that said "You mean it just goes around and
2 around forever?" You know, not really, but -- we
3 just thought that was a good way of approaching it.

4 So anyway, with the traditional approach, you
5 begin the preapplication process three to five years
6 before the application is due to be filed at FERC,
7 and you go through what's called a three-stage
8 consultation. Very regulatory in nature. The
9 outline -- or the regulations outline things in
10 very -- a lot of detail. There's opportunity for
11 like at least one public meeting that involves public
12 and NGOs, but it's primarily focused on resource
13 agencies and Indian tribes. So that our traditional
14 process, three-stage consultation was focused and it
15 had a little bit of public involvement but not a lot.
16 Typically the public would not get involved until
17 after the application is filed with FERC.

18 So once, you know, the application is filed
19 and FERC goes and does its NEPA process, which
20 typically can take -- well, in the case of a
21 recent California licensing, it took us about 29
22 years. So we're not proud of that.

23 So back in -- I'm sure many of you have
24 probably heard of the FERC class of '93, which is a
25 157 applications that all expired around the same

1 time. They were going to expire -- or, excuse me,
2 expire in 1993. So we had 157 applications filed
3 with FERC in 1991. A huge, huge glut of applications
4 that FERC needed to process with its traditional
5 process.

6 The problem -- the biggest problem that we
7 had, we found that 94 percent of those 157
8 applications, once they came to FERC, they still
9 needed additional information that FERC staff would
10 need in order to make -- in order to finish their
11 NEPA document and for the Commission to make its
12 public interest call. So we were going out with a
13 lot of letters back to applicants -- this is after
14 that three-stage consultation process for --
15 especially for additional studies. And sometimes
16 those additional studies, those of you who are from
17 resource agencies understand that, you know, it's --
18 sometimes you need two, three, four field seasons to
19 get a lot of these studies done. It took a lot of --
20 a lot of time.

21 So that meant only 15 percent were completed
22 by the expiration date, and the remainder had to go
23 on annual license. So it was a real protracted
24 process. Now we've completed -- we're almost done.
25 We've completed about 143 -- actually, it's probably

1 a little bit higher now -- to date.

2 And here is -- the second big component was 80
3 percent of the completions had rehearings. In other
4 words, 80 percent of the time there were a lot of
5 unhappy people with the license. And the rehearing
6 process is something where when -- it's like -- for
7 lack of a better term, it used to be called an appeal
8 process, but that's another story. But it's like an
9 appeal process. You come back and you must file a
10 rehearing with FERC. And if you're not satisfied
11 there, then it moves into the court system. So this
12 is the beginnings of a lot of litigation. Eighty
13 percent of those things -- of these applications had
14 rehearings.

15 We never -- right now we have 14 of them that
16 remain because of maybe a CZMA issue or 401 issue,
17 and there might be some ongoing settlement
18 negotiations.

19 So after that, FERC's staff sort of came to a
20 few conclusions in that our traditional licensing
21 process was -- number one, it was too long. It just
22 took too much time. A lot of good benefits to the
23 resources had to wait. Things were delayed. People
24 weren't happy. Believe it or not, a lot of
25 applicants weren't happy, I mean, with this -- sort

1 of this new age of power markets and things and
2 economic uncertainty. I think a lot of the industry
3 wants some kind of uncertainty. They don't want
4 their license held in limbo forever while things are
5 worked out. And we also felt because of all those
6 rehearings that the process had become too
7 contentious. People were not communicating.

8 So we came up with this Alternative Licensing
9 Process. And the key here was to try to expand the
10 participation in the FERC process; expand it out to
11 the public, expand it out to the NGOs, move it beyond
12 the resource agencies and the tribes at a very early
13 stage in order to resolve conflicts early in the
14 process before it comes -- the -- before the
15 application comes to FERC and try to accommodate more
16 of the interests of the participants.

17 So the goals of our Alternative Licensing was
18 to essentially, what we call, front load NEPA. Move
19 a lot of the NEPA work from the FERC side of that
20 circle over to the three-stage consultation side and
21 get a lot of the work done a lot earlier, which is
22 why we're having these scoping meetings here today
23 and now. And so we did this so we can facilitate an
24 evaluation of all stakeholder interests early in the
25 process. And we -- hopefully this will expedite the

1 licensing process. And we are beginning to see that
2 it does.

3 So getting back to our circle. Beginning the
4 ALP, typically three to five years, sometimes much
5 earlier than that. So that there's an ALP team which
6 Rick's going to describe in detail, how DWR's
7 approaching the problem. The ALP team consists of --
8 typically a plenary body, a large body, a lot of
9 stakeholders, then a lot of technical work groups,
10 environmental, engineering, recreation, however the
11 group decides to do it, and a lot of task forces and
12 subgroups.

13 And then with the -- with the goal that this
14 application is going to be filed by this ALP team and
15 then given over to the FERC team, which still has its
16 own NEPA responsibilities that we -- that we have to
17 do -- we still have to do either our EIS or EA and
18 then get into a license decision. So we're hoping
19 that we use this time effectively to cut down the
20 number of time that the application sits in
21 Washington being made for -- being with -- with
22 decisions that are being made primarily for people
23 inside the Beltway.

24 So this is a little bit more detail. A lot of
25 these things that used to be over here are now over

1 here. So we have Collaborative meetings and scoping,
2 like we're here today, to the development of study
3 plans so studies can be conducted and the results
4 issued, and then the groups can decide if more
5 studies are needed with a goal of coming up with some
6 sort of a preliminary DEA that FERC can use in
7 preparing its own Draft and Final NEPA document. And
8 hopefully we also will -- hope that we can get from
9 the resource agencies at least draft recommendations
10 and conditions up front and early in the process.

11 So, you know, I'm not going to go through
12 one -- each one of these, but some of the more
13 important things here, as I said, the traditional
14 process, very regulatory. Not a lot of flexibility.
15 Alternative process, you design the process. You
16 design your own process, when study plans are going
17 to be reviewed, how long do you have. It's totally,
18 totally up to you.

19 Traditional is focused on exchanging a lot of
20 mail back and forth. Alternative -- and I don't have
21 to say this, involves a lot of meetings. And a lot
22 of you are going "Yeah, no kidding."

23 The traditional is applicant and agency
24 driven. This is more locally driven. This is a big
25 one for me is that because of the contentious nature

1 of the traditional process, environmental benefits
2 might be delayed. Through the alternative, the
3 environmental benefits can be realized sooner.

4 And in the traditional process, not a lot of
5 room for FERC participation. And a lot more room for
6 FERC participation in the alternative process.

7 So what have we seen so far? So under the ALP
8 we've licensed 21 projects, and right now we're like
9 seven months to two years processing time down from,
10 say, you know, two to five years on the average of
11 processing time. Our average is about 17 months.
12 We're trying to get that down even further. Right
13 now we have 10 projects in front of us with ALP
14 applications and 36 projects, of which this is one,
15 that are in the prefiling stage of an ALP.
16 Hopefully, like I said before, less need for
17 additional information when it comes to FERC and
18 fewer hearings.

19 So what have we got going today? What are the
20 kinds of things we're looking for. We're here today
21 primarily to identify issues, to solicit information
22 from you folks. Something we probably won't be
23 getting into a whole heck of a lot today -- the work
24 groups are primarily working on this one -- the depth
25 of the analysis, how we're going to do our NEPA

1 Analysis, maybe identifying any cumulative impacts
2 that some of the work groups may have missed and, if
3 possible, identifying any reasonable alternatives
4 from the project.

5 So basically we're looking for your comments.

6 Thank you.

7 MR. RAMIREZ: Thank you, Tim.

8 The thing I like best about those FERC
9 presentations is that I'm always able to point to
10 them as the creators of this process that we're
11 following. Because in reality, it's quite a
12 challenge to conduct all the different elements of
13 that process and to involve all the different players
14 in a manner in which we try to collaborate with all
15 the different interests. The reality is there's a
16 lot of conflicting interests, and we are working very
17 hard to try to find a way of accommodating and/or
18 balancing those interests with the Department's
19 primary objective in the relicensing, which is to run
20 its water project or run the Oroville facilities as
21 part of that water project.

22 But thanks, Tim. There was a lot of good
23 information that I think people aren't always aware
24 of.

25 What I want to do in the time I've got now is

1 to kind of place the scoping meeting today and the
2 one we had yesterday within the context of the
3 overall relicensing process. And as I mentioned in
4 my opening remarks, we had a lot of information on
5 display, and we had people that were available to
6 answer any questions you might have had.

7 And Tim referred to some of the breakdowns --
8 or some of the resource interests that are involved
9 in relicensing, and that's exactly what we have in
10 our particular process. You see them there by topic.

11 But I do want to get on quickly to the reason
12 we're here, which is collection of public comments.
13 So I'm going to go through our next couple of slides
14 fairly quickly, but just -- just touch base, though,
15 again on what we hope to accomplish with the overall
16 scoping process, and that is to summarize
17 environmental issues, help determine what issues
18 should be addressed in the relicensing process. And,
19 as Tim mentioned, we are combining the results of
20 this meeting in terms of public comment, public input
21 with our ongoing work group and Collaborative
22 process.

23 Next slide. And, again, just briefly, we've
24 heard from Tim from FERC as to what relicensing is.
25 And it's the process by which the generation

1 facilities, in this case the Oroville facilities, are
2 licensed by the -- by FERC. We're hoping to get a
3 new license, and that license will specify terms and
4 conditions that will determine how the facilities are
5 operated. There will be terms and conditions that
6 translate any protection mitigation and enhancement
7 measures that would be required to address any
8 potential resource concerns with our proposed
9 operation over the new life of the license.

10 Just a few facts about the Oroville
11 facilities. As I mentioned, they're part of the
12 State Water Project. The State Water Project, of
13 course, is intended to supply supplemental water
14 deliveries to 29 state water contractors that receive
15 water from the -- from California Aqueduct. The
16 Oroville facilities has an existing FERC license
17 boundary that encompasses 41,000 -- just over 41,000
18 acres. The license capacity of the power facilities
19 is at 762. The Oroville facilities are a
20 multipurpose project which provides flood protection,
21 recreation, enhances fish and wildlife habitat, and
22 also improves water quality through releases that
23 make it to the Delta.

24 We have selected the ALP. I think Tim
25 identified the benefits that we hope to realize from

1 going through the ALP as opposed to the traditional.
2 And we have, in fact, have maybe just under a year of
3 experience with the Collaborative. We've had
4 meetings upon meetings. Someone has actually --
5 making a count of all the meetings. I don't think
6 any one of us quite yet realize how many meetings
7 we've had. There's been so many meetings in
8 different resources areas that I think we'll be
9 surprised by the number of meetings we've had. But
10 they have made progress. I'm happy to say there's
11 been progress in just about every area. And so we
12 have progressed very, very slowly, but we have made
13 progress along all fronts.

14 The structure we have developed in conjunction
15 with the stakeholders is what you see in front of you
16 there on that slide. We have separate work groups in
17 each of those different resource areas. They conduct
18 their own separate meetings on a monthly basis. They
19 have convened task forces to look at specific issues.
20 They, in turn, are feeding results back up to the
21 overarching plenary group where the stakeholders and
22 the applicant are able to look over the entire
23 process and see exactly how different issues may need
24 to be balanced.

25 This is just a sample list, actually, of some

1 of the participants that have been active in the
2 process. I won't go through them item by item, but I
3 think you would find several specific categories
4 there. We have very active Indian tribe involvement
5 in the Oroville area. The federal government has
6 identified four recognized -- federally recognized
7 tribes in the Oroville Project area. So we have had
8 quite a bit of Indian tribe involvement. We've also
9 had a large element of local recreation interest that
10 has been active in the process. We've had local and
11 county governments. We've had various state
12 agencies. And, of course, we've had a large presence
13 from the federal agencies. And so we convene monthly
14 meetings with various elements from the stakeholder
15 group. I believe our total contact list for this
16 project now totals about 1,200. Fortunately they
17 don't all show up for every meeting, but we do get
18 quite a turnout.

19 Okay. It looks like we're trying to sneak an
20 extra year in there. I see "2002" twice. Maybe that
21 will work.

22 MS. KROEN: It's going to be a long year.

23 MR. RAMIREZ: Maybe that will work. But this
24 is just meant to show what the overall process is
25 trying to meet. The date that we cannot change, of

1 course, is when the license expires in 2007. And we
2 also cannot change the date that the license -- the
3 new license application must be filed, which is in
4 2005. So between now and 2005, we are attempting to
5 identify studies, conduct those studies, and then see
6 how those studies support PM&E measures that will
7 lead to terms and conditions that appear in the
8 license.

9 We also, because this is a collaborative
10 process, hope to come to agreement with stakeholders.
11 And so we'll see evidence of that in our settlement
12 agreement which should follow the studies that will
13 provide data to help drive specific proposals.

14 Now, I believe out on the tables in the lobby
15 area we do have Scoping Document 1 which was
16 distributed, I believe, earlier last month. Let me
17 see if we've got that. Yeah, actually, September --
18 September 27th. Within the Scoping Document you will
19 see exactly what issues that the Collaborative Group
20 have identified and which are candidates for further
21 study as the process continues to unfold. We'll
22 combine any comments we get through this process and
23 the meeting last night with those particular issues.
24 And our goal is to issue the final Scoping Document
25 No. 1 early next year.

1 Just to give you an inkling of the types of
2 issues, we've got a couple of slides here that I'll
3 go through very quickly. But in the area of
4 recreation and socioeconomics, there's been questions
5 as to the adequacy of our existing project recreation
6 facilities. There's been other questions related to
7 what have been the economic impacts of the Oroville
8 facilities on the local area.

9 One thing I did fail to mention is that this
10 slide presentation will be available to anybody that
11 wants it on our Oroville Relicensing website. And
12 I'll give you the address of that in just a few
13 minutes.

14 On the environmental side, our Environmental
15 Work Group has uncovered some issues that need to be
16 studied in the area of geology, water quantity,
17 quality, terrestrial, fisheries, et cetera. And I'll
18 leave it to you to look at those at your leisure
19 later. Engineering and Operations, we're evaluating
20 the potential for adding additional generation within
21 the existing infrastructure. It's possible we'll be
22 looking at the effect of future water demands on
23 various aspects. Land use, land management and
24 aesthetics, another resource area that we are looking
25 at. People have asked about our existing and future

1 fuel loads, fuel management practices. There's a
2 question about the use of project lands for public
3 use, access, et cetera.

4 Cultural resources, there -- as I mentioned
5 earlier, there's been a large representation by the
6 federally recognized tribes and actually unrecognized
7 tribes as well that have led to a separate work
8 group. And we are actively engaged with them on
9 issues that they feel are very important to their --
10 to their particular interests. And, again, all these
11 issues must be examined within the -- as the word is
12 used, the nexus to project operation. We are
13 interested as an applicant in seeing how our project
14 affects each of these resource areas and what we
15 might do in our operation to mitigate, protect or
16 enhance any impacts or use of those particular
17 cultural resources. So, again, I just want to stress
18 that there is that nexus. It's -- the Department as
19 an applicant is trying to assess how its proposed
20 operation does, in fact, affect these areas.

21 Okay. I actually think that concludes my
22 portion. I think we're going to have Patti Kroen,
23 who's been our facilitator in the Collaborative spend
24 a few minutes specifying how our public comment
25 portion of this meeting will be conducted.

1 Thank you.

2 MS. KROEN: Thank you, Rick.

3 I'd like to add my welcome to all of you. As
4 Rick mentioned, I have had the privilege of
5 facilitating all those meetings that Tim and Rick
6 mentioned as a part of the Oroville Facilities
7 Relicensing Collaborative Process.

8 The way -- the way we're going to run this
9 this afternoon, same -- same as we did last night.
10 As you came in and signed in, you were asked if you
11 wished to speak. And those of you who knew at that
12 time you wanted to speak, signed up on a sheet. I
13 have that sheet in front of me, and it includes 12
14 names. First in will be first up. So I'll read the
15 list of names to you, and you'll know in what order
16 you'll speak.

17 We do have Sandra here, who is the court
18 reporter, and her job is to make sure that the
19 comments you provide are taken down correctly. That
20 requires you to do a couple of things. Remember that
21 you can read faster than anyone can type. So you
22 need to really slow down. If you have a prepared
23 statement and you can leave it with us, that would be
24 great. And then perhaps just summarize -- I'm a
25 little close to this, I guess -- summarize your

1 comments into the microphone so that Sandra can take
2 it down as you give the comments and you can provide
3 a more lengthy written comment, if you like.

4 The written comments will be dealt with the
5 same way as the oral comments given today. So if you
6 don't speak today but you do want to submit written
7 comments, you're encouraged to do that. There will
8 be a slide up here in a moment that tells you where
9 you can send them. In addition, the packet that you
10 picked up at the table has a comment sheet in it, and
11 it's designed so that you can write your comment on
12 it and then fold it over and send it in to the
13 address that's already stamped on the back of it. If
14 you have more than one page of comments, of course,
15 you can put it all in an envelope and send it along.

16 It says on the slide to limit your verbal
17 comments to four minutes. I've taken the liberty of
18 making a facilitator's choice and upped that to five
19 minutes. So you have an extra minute. We have 12
20 folks who want to speak. So if all of you stay
21 within the five-minute time frame, we'll have some
22 time at the end for any of you who decide during the
23 meeting that you'd like to speak. You'll be given an
24 opportunity to approach the microphone and provide
25 comments at that time.

1 Please keep your comments focused on the
2 Oroville Facilities Relicensing. This setup doesn't
3 afford a question-and-answer type of format, but all
4 of these folks, Rick and Tim and the Resource area
5 managers and the consulting team that are here today,
6 would be happy to hang around -- excuse me -- a
7 little bit after the meeting. If you have some
8 questions that you'd like to ask them, please feel
9 free to do that. And I hope you take advantage of
10 checking out the information that's on the tables in
11 the back of the room. There's some real good
12 information back there.

13 There are also some business cards on each of
14 the tables that include the contact information that
15 will be on the next slide. So you don't have to
16 write it all down here. The e-mail address,
17 telephone, toll-free telephone number and address is
18 included on that card. It's also included in the
19 Scoping Document. So you should be able to figure
20 out how to get comments submitted. Comments on the
21 scoping document are due by November 26th. They're
22 always welcome ahead of time.

23 So the order in which the comments will be
24 received, I'll read the names through. Then if
25 you'll come, approach the microphone. Make sure that

1 you give Sandra your name, spell it, the last name,
2 if necessary, and your affiliation, if any. As soon
3 as that process is done, we'll start the timer and
4 you're off.

5 All right. So the order is Mike Wade, John
6 Coburn, Mary Lou Cotton, Dan Smith, Nan Nalder --
7 I'll remind you of this as we go through so you don't
8 have to remember. Ed Ely, Geoff Vanden Heuvel,
9 Vincent Wong, Tim Quinn, Wilson Head, Don Marquez and
10 Lisa Wolfe.

11 So Mike Wade and John Coburn are first.

12 Mike, you're up.

13 MR. WADE: Thank you.

14 My name is Mike Wade. I'm Executive Director
15 of the California Farm Water Coalition. The only
16 statewide non-profit education organization dedicated
17 solely to providing factual information to the public
18 on agricultural water use.

19 I'm sure others will attest to the importance
20 of the water supply received from the State Water
21 Project. In the agriculture sector, that water
22 irrigates approximately 750,000 acres of some of the
23 state's most fertile farmland. Water supplies from
24 the State Water Project not only help feed the nation
25 but the entire world.

1 Today, the agricultural economy is subject to
2 many stresses and competitive forces in the global
3 marketplace. Obviously a reliable and sufficient
4 water supply is critically important in order for
5 California growers to compete.

6 We all understand that California's current
7 water supply is not adequate to meet the needs of
8 farms, cities and the environment, not even in years
9 of normal rain and snowfall and especially not in
10 years of drought. Any reduction in water supplies
11 available to the customers of the State Water Project
12 due to regulatory actions under this relicensing
13 process would have severe impacts and should be
14 avoided.

15 Just as important as the sufficient quantities
16 of water is the price of water. The State Water
17 Project is user-financed. Each of the 29 contractors
18 is required to pay its proportionate share of the
19 capital operations and maintenance costs incurred by
20 the project. As water supplies go down, because of
21 these fixed costs, the unit price of water increases.
22 As other costs go up, the net price of water goes up
23 as well. This past year, because of the turmoil in
24 our energy marketplace, we've seen significant price
25 spikes in the cost of energy to deliver that water.

1 For example, in Kern County, the largest State
2 Water Project agricultural water user has costs that
3 average about \$55 dollars an acre foot.
4 Approximately 28 percent or \$15.40 of that costs is
5 attributable to the power required to move that water
6 to Kern County. But this year, with only a 39
7 percent supply and a volatile energy market, that
8 unit cost of water increased to about \$150 an acre
9 foot and power costs to move the water increased by
10 50 percent to 22.50 an acre foot.

11 In addition to the issue of price, water
12 temperature and crop production in certain parts of
13 the state are closely tied. According to the
14 University of California Cooperative Extension,
15 certain crops, such as rice, need water temperatures
16 of at least 65 degrees during the four-week planting
17 period in late spring and at least 59 degrees until
18 the irrigation season is completed at the end of
19 October.

20 Most Californians have invested in both the
21 water and power benefits of the State Water Project.
22 Those benefits accrue to the entire state by
23 sustaining a dynamic economy and support our growing
24 population. We cannot continue to prosper if we
25 price our water supply out of reach of farmers. We

1 cannot meet the challenges of the future if we are
2 constantly reducing the water and power supplies
3 already developed and available for our use.

4 When relicensing the hydropower facilities at
5 Lake Oroville, we ask that you keep these important
6 benefits in mind as you reach decisions that can
7 impact much of the state for years to come.

8 Thank you.

9 MS. KROEN: John Coburn.

10 MR. COBURN: Thank you, Patti.

11 I think it's somewhat uncanny that just about
12 any of the drought hearings I go to or a hearing
13 where I have to show up to defend the State Water
14 Project water supply that it turns out to be raining
15 on the way over here. So it seems like we're still
16 batting a thousand today, but we hope we get lots
17 more rain.

18 Good afternoon. My name is John Coburn. I'm
19 the General Manager of the State Water Contractors.
20 Retaining or enhancing the current water supply and
21 power generation from the Oroville facilities is
22 essential for maintaining a reliable and affordable
23 water supply for the 23 million Californians and
24 750,000 acres of farmland served by the State Water
25 Project.

1 The State Water Contractors represent 27
2 public agencies throughout California that have
3 long-term water supply contracts for supplemental
4 water supply from the State Water Project. Planned,
5 constructed, operated by the California Department of
6 Water Resources, the State Water Project is the
7 largest state-built, user-financed, multipurpose
8 water project in the United States. Its main
9 purpose is water supply.

10 The project diverts and stores surplus water
11 during wet periods and distributes it to service
12 areas in northern California, San Francisco Bay Area,
13 San Joaquin Valley, the Central Coast and Southern
14 California. Other project purposes of the State
15 Water Project include flood control, power
16 generation, recreation, fish and wildlife protection,
17 water quality improvement in the San Joaquin,
18 Sacramento Delta.

19 The State Water Project Contractors, as a
20 previous speaker noted, are responsible for all costs
21 related to the water supply development and power
22 generation from the Oroville facilities. State Water
23 Contractors are concerned that operational changes
24 that may be proposed during this relicensing process
25 could negatively impact future water costs.

1 Operational changes that result in reducing power
2 generation capability and flexibility will result in
3 increased costs to the State Water Contractors and
4 ultimately much of the state's population.

5 Any loss of generation at Oroville requires
6 the State Water Project to purchase replacement
7 energy. This not only increases the cost of water,
8 it imposes an additional demand on an already scarce
9 electrical energy supply within California. However,
10 the State Water Contractors' greatest concern is the
11 possibility that operational changes will erode the
12 water supply available to the State Water Project.

13 California is on the verge of a water supply
14 crisis that may well dwarf California's current
15 energy crisis. The Oroville Relicensing Process must
16 move forward without duplicating ongoing efforts on
17 an environmental and flood management issues if we
18 are to ensure sound management of the state's
19 limited, limited water resources.

20 The State Water Contractors appreciate the
21 need to protect California's environment. The State
22 Water Contractors are deeply involved in the ongoing
23 CalFed process. The CalFed, which is a consortium of
24 state and federal resource agencies that is
25 addressing the water quality, water supply, ecosystem

1 needs of the Sacramento, San Joaquin River Delta and
2 San Francisco Bay issues. The CalFed process is
3 striking a delicate balance between water supply and
4 the environment. The impacts of the CalFed Programs
5 will stretch well beyond the Bay-Delta area and
6 encompasses the Feather River and the program's
7 Solutions Area.

8 This relicensing process must proceed in full
9 recognition of the overall CalFed Program, the
10 Central Valley Project Improvement Act and other
11 ecosystem restoration initiatives. State Water
12 Project supplies are already contributing to the
13 CalFed process and its success.

14 Similarly, a joint state and federal effort is
15 underway to identify and address flood management,
16 public safety and ecosystem restoration issues within
17 the 43,000-square-mile Sacramento/San Joaquin River
18 watersheds. Congress and the California legislature
19 authorized this multi-agency effort in response to a
20 massive Central Valley flooding that occurred in
21 1997. The goal of the Sacramento/San Joaquin River
22 Basins Comprehensive Study is a master plan for the
23 Sacramento/San Joaquin River Basins that address
24 flood damage reduction and ecosystem restoration
25 within the Central Valley.

1 The environment and flood management studies
2 undertaken in the relicensing process need to be
3 tightly focused within the project boundaries. Any
4 options considered must be complimentary to ongoing
5 efforts such as the CalFed Program and the
6 Sacramento/San Joaquin Basins Comprehensive Study and
7 not result in any additional losses of State Water
8 Project water supplies.

9 Restructuring of the California power market
10 has highlighted the importance of hydroelectric
11 projects beyond their traditional capacity and energy
12 production values. Maintaining or increasing the
13 flexibility in releases is required to continue the
14 beneficial use of the Oroville facilities for
15 providing regulation, spinning reserves, non-spinning
16 reserves, replacement reserves and voltage control
17 required for a reliable operation of the State Water
18 Project and the California power grid.

19 MS. KROEN: Wrap it up.

20 MR. COBURN: Okay. One last paragraph.

21 The State Water Contractors recommend --
22 recognize that the relicensing process involves the
23 balancing of water and power supply benefits with
24 environmental, recreation and flood management needs.
25 The State Water Contractors urge the Department of

1 Water Resources and the other relicensing
2 participants to seek innovative and creative
3 solutions to meet those needs, solutions that do not
4 needlessly sacrifice precious power and water
5 resources.

6 We will be submitting additional comments
7 before the November 26th deadline. Thank you.

8 MS. KROEN: Mary Lou Cotton.

9 MS. COTTON: I am Mary Lou Cotton --
10 C-o-t-t-o-n -- Assistant to the General Manager of
11 the Castaic Lake Water Agency. That's C-a-s-t-a-i-c.

12 The Castaic Lake Water Agency is a contractor
13 with the California Department of Water Resources for
14 our water supply from the State Water Project. The
15 agency's service area is comprised of the
16 Santa Clarita Valley located in northern Los Angeles
17 and eastern Ventura Counties. Our SWP supply meets
18 approximately 50 percent of our local water demand
19 and is vital to the economic well-being of our
20 community.

21 As an SWP contractor, the agency is
22 responsible for its portion of the costs to water --
23 to water supply development and power generation at
24 the Oroville facilities. Any operational changes
25 that result in reducing the power generation

1 capability and flexibility will result in increased
2 costs to the agency and to all the SWP contractors.

3 Of greater concern to our agency and the other
4 contractors is the possibility that operational
5 changes will erode the water supply available to the
6 project. It's hard to imagine any credible
7 operational changes that would justify reducing the
8 water supply yield from the Oroville facilities.

9 While the agency appreciates the need to
10 protect California's environment, we are very
11 concerned about the potential for duplication of
12 efforts between the Oroville Relicensing Process, the
13 CalFed Bay-Delta Program, the Central Valley Project
14 Improvement Act and other programs.

15 The environmental studies undertaken in the
16 relicensing process need to be tightly focused within
17 the project boundary, and any options considered must
18 be complimentary to the CalFed Program and not result
19 in losses to State Water Project water supplies.

20 The agency recognizes that the FERC
21 relicensing process involves the balancing of power
22 and water supply benefits with environmental,
23 recreational and flood management needs.

24 We urge that this process seek solutions to
25 meet these needs, but they should be solutions that

1 do not sacrifice water and power resources.

2 Too late.

3 MS. KROEN: Nice try, Will.

4 Dan Smith.

5 MR. SMITH: My name is Dan Smith. I'm
6 Director of Regulatory Affairs for the Association of
7 California Water Agencies.

8 The Association is comprised of about -- just
9 in time -- 400 public agency water suppliers
10 throughout the state that deliver about 90 percent of
11 the distributed water in California for farms, homes
12 and businesses. Many of the State Water Contractors
13 are members of our Association.

14 I'm going to leave behind a written statement,
15 so I'm just going to summarize a couple of points
16 here.

17 Our Association of water leaders over the past
18 century have worked very hard to keep coming for
19 Californians a supply that will meet the growing
20 needs that we have experienced. That has become
21 increasingly difficult over the past 20 years. And
22 in the past 10 years, we've actually seen a reduction
23 in the available water supply, 1 million acre-feet
24 during a dry year. And that's primarily the result
25 of regulatory and legislative actions. So as you

1 might guess, we're very wary of regulatory
2 proceedings that will have impact on water supply.

3 But we want to urge that the participants in
4 this proceeding be aware that the actions they take,
5 the decisions they make will have significant impact
6 on most of California and most Californians.

7 In our view, a successful relicensing
8 proceeding will be one that retains the important
9 power and water benefits of the Oroville facilities.
10 And we hope the decision makers agree with us.

11 Thank you.

12 MS. KROEN: Nan Nalder.

13 MS. NALDER: Thank you. My name is Nan
14 Nalder, and I was asked to read a statement into the
15 record for a person who could not be here. So I'm
16 making these comments on behalf of Dominic DiMare
17 from the California Chamber of Commerce. And we have
18 given nine copies of these comments so that you can
19 take your notes carefully and not worry about it.

20 The Chamber of Commerce represents over 12,000
21 businesses. And they very much appreciate the
22 opportunity today to provide the Commission and the
23 rest of you in the audience with our thoughts
24 concerning the relicensing.

25 For more than a year, California has struggled

1 to extricate itself from the grips of an energy
2 crisis. Last fall and winter, California weathered a
3 series of rolling blackouts attributable to an
4 insufficient supply of electricity. There were many
5 days when the State Reserve Margin dipped below 1.5
6 percent. Our business leaders and elected officials
7 have come to appreciate that every megawatt counts.

8 Over reliance on electricity generated outside
9 of our state puts us vulnerable to blackouts. And we
10 are very concerned that we retain the entire output
11 of the Oroville facilities to keep the grid stable
12 and to provide the energy that we so very much need
13 to keep California in a stable sense.

14 Like electricity, California faces difficult
15 challenges concerning water supply and price. As the
16 state's population continues to grow -- and I think
17 you've heard some figures of this from the earlier
18 speakers -- it's very difficult to be able to meet
19 that demand. And so our members are also wanting to
20 encourage the Commission and the other participants
21 to keep this in mind as you deliberate through this
22 relicensing.

23 We support -- this is important -- that the
24 Chamber of Commerce supports the Department and
25 supports the participants in this Alternative

1 Relicensing. We support the Commission, and we want
2 very much to see this project relicensed. We'd
3 request that you take into consideration our
4 concerns, and we thank you very much for giving us
5 the opportunity to present this for the record. And
6 we did provide copies.

7 Thank you.

8 MS. KROEN: Thanks, Nan.

9 Ed Ely.

10 MR. ELY: My name is Ed Ely -- E-l-y. We've
11 also provided copies of this for the record. I'm
12 presenting this statement on behalf of Rex Hime,
13 California Business Properties Association.

14 On behalf of the California Business
15 Properties Association, I want to thank the
16 Commission for this opportunity to be able to address
17 the vital importance of the Lake Oroville hydropower
18 facilities in the state's overall economy.

19 By way of background, California Business
20 Properties Association is the leading designated
21 legislative advocate for the International Council of
22 Shopping Centers, the California Chapters of the
23 National Association of Industrial Office Properties,
24 Associated Builders and Contractors of California,
25 Commercial Real Estate Women and the Institute of

1 Real Estate Management.

2 The California the Business Properties
3 Association represents over 5,000 members, including
4 major landowners, developers, retailers, tenants,
5 contractors, builders, lawyers, brokers and
6 individuals involved in all aspects of commercial and
7 industrial real estate.

8 I can tell you from firsthand experience that
9 it is difficult, time consuming and a contentious
10 process in this state to bring new water supplies on
11 line to meet the needs of our growing economy. That
12 is why it is so important that we maintain the water
13 supply that we currently have because we can't afford
14 to lose any more ground.

15 The business community became actively
16 involved in the California water issues during the
17 last drought when regulatory constraints and
18 naturally occurring water shortages put the state's
19 economy and environment on a collision course.

20 At our prompting, the state of California and
21 the federal government developed the Bay-Delta Accord
22 to stabilize environmental resources in the Bay-Delta
23 and resource a measure of reliability to water
24 supplies dried from the state and federal water
25 projects.

1 From that agreement, we embarked on a lengthy
2 progress known as the CalFed Bay-Delta Program which
3 sought to develop and implement a long-term
4 comprehensive solution to the environmental and water
5 management conflicts that had long plagued the
6 Bay-Delta Estuary. That process culminated last year
7 in a creative decision between the state and federal
8 government.

9 This year we are working hard to get a
10 federal -- to get federal legislative passed to
11 implement that agreement. Over the past decade, we
12 have seen well over a million acre feet of water
13 previously dedicated to use on farms and in the
14 cities reallocated for environmental purposes. A
15 cornerstone of the CalFed solution is recognizing the
16 need to develop more water storage. We are certainly
17 not there yet, and we have a long way to go before we
18 attain that critical goal. In the meantime, we must
19 draw a line in the sand and closely question any
20 regulatory proceeding that would further reduce our
21 current water supplies. The bar must be raised high
22 to justify any such action.

23 The CalFed solution area encompasses the
24 Feather River Watershed, and any additional
25 environmental actions contemplated by this

1 relicensing must not be duplicative of those
2 efforts.

3 Californians have invested more than
4 \$9 billion in the State Water Project, a significant
5 portion of which went to building Lake Oroville and
6 the associated hydropower facilities. Today, more
7 than 30 years after the first deliveries from the
8 project were made to the Bay Area, we still do not
9 have the full supply developed.

10 An adequate supply of high-quality water is
11 one of the key priorities of the California business
12 community. Actions taken in this relicensing process
13 will not affect just the immediate Oroville area, but
14 will resonate throughout most of California. The
15 process must fully weigh its actions in light of
16 their potential negative impacts. California cannot
17 afford to lose any more water due to regulatory fiat.

18 Thank you for your consideration.

19 MS. KROEN: Geoff Vanden Heuvel. Is that
20 close?

21 MR. VANDEN HEUVEL: That's very good.

22 Geoffrey is G-e-o-f-f-r-e-y. Vanden Heuvel is
23 V-a-n-d-e-n, H-e-u-v-e-l. And I'm presenting
24 testimony regarding the relicensing of the Oroville
25 hydropower facilities on behalf of the Southern

1 California Water Committee.

2 The Southern California Water Committee is a
3 nonprofit, nonpartisan educational organization
4 dedicated to ensuring that California has sufficient
5 water supplies to support a strong economy and
6 growing population.

7 Southern California Water Committee is a
8 powerful voice for Southern California because it
9 reflects a broad consensus on water issues. The
10 Committee is composed of leaders from business,
11 government, agriculture and water agencies in
12 Los Angeles, Orange, San Diego, San Bernardino,
13 Imperial, Riverside, Ventura and Kern Counties. For
14 example, our members include Unocal, Anheuser-Busch,
15 Pacific Telesis Group, Proctor & Gamble, Ralph's,
16 Food 4 Less, The Gas Company, Sunkist Growers, Heinz
17 Nurseries, The Building Industry Association of
18 Southern California, Milk Producers Council, and over
19 40 cities and their City Councils.

20 Water is our sole interest. We are an
21 independent advocate for Southern California's water
22 interests. As an organization, we have been actively
23 involved in the CalFed Bay-Delta Program and a 4.4
24 Plan for the Colorado River. Strong leadership and
25 the collective expertise of our members allow the

1 Water Committee to contribute ample resources and
2 viable strategies toward resolving these statewide
3 efforts.

4 Southern California has undergone a dramatic
5 shift over the past decade in how our water supplies
6 are managed. Our large urban areas are essentially
7 getting by on the same amounts of water they used ten
8 years ago despite sizeable population increases. We
9 are able to do that in part thanks to extraordinary
10 levels of water conservation and water recycling. We
11 are a national leader in water-use efficiency.

12 We have also seen increased regional efforts
13 to maximize local water resources so that we can be
14 assured of having necessary water supplies in the
15 inevitable dry years. Nonetheless, the region's
16 water future is not completely assured. We face
17 challenges in meeting the requirement to reduce our
18 dependence on the Colorado River. The State Water
19 Project's supply reliability is in part contingent on
20 continued progress in implementing the CalFed
21 solution. Overall planning efforts to meet our
22 expected future water needs are predicated in part on
23 certain levels of water supply reliability from the
24 State Water Project.

25 Project water is important not only to meet

1 the immediate supplemental supply needs of Southern
2 California, but also to allow us to meet water
3 quality goals by blending -- which we need the clean
4 water to blend with the Colorado River supplies which
5 are high in salt.

6 Southern California has already lost
7 significant water supplies under the Bay-Delta Accord
8 and other regulatory actions. We have not seen any
9 of the new supplies promised under the CalFed
10 Program. We cannot afford to further reduce the
11 amount of supplement water necessary to support
12 Southern California's economy and population.

13 Our goal for the relicensing of the Oroville
14 hydropower facilities is to maintain the level of
15 benefits we currently receive from water stored at
16 the reservoir and to continue to use
17 project-generated power to help offset the cost of
18 that water.

19 Southern California has invested billions of
20 dollars to the State Water Project, including the
21 Oroville facilities. This is an investment that we
22 absolutely need to protect.

23 MS. KROEN: Vince Wong.

24 MR. WONG: Thank you, Patti. I've submitted
25 written comments as well, so I'll just paraphrase my

1 statements.

2 I'm Vincent Wong -- W-o-n-g -- with Zone 7 of
3 Alameda County Flood Control and Water Conservation
4 District. I'm here to stress the importance of
5 retaining and enhancing the water supply and power
6 generation of the Oroville facilities. It's
7 essential for maintaining the -- the economy of --
8 the -- my community as well as California as a whole.

9 Zone 7 is in the eastern portion of Alameda
10 County, representing 180,000 people, serving
11 Livermore, Pleasanton and Dublin. We're one of three
12 contractors serving the southern and eastern portion
13 of the Bay Area.

14 Basically, there are three points I want to
15 make. One of them is that any operational changes in
16 reducing power generation will increase the cost to
17 my constituency. These are costs that will have to
18 be covered by all of the constituency in the state of
19 California. More important is any operational
20 changes that will erode the water supply is very
21 stressful to us.

22 The water supply contract that we signed in
23 1961 called for, aggregately, 4 million acre-feet.
24 We know that the project can only on an average
25 produce about three-fourths of that.

1 Lastly, I wanted to point out that it's
2 important for the relicensing process to recognize
3 the CalFed, the Central Valley Improvement Act and
4 other ecosystem restoration initiatives. We
5 recognize the importance of balancing the environment
6 with water supply as well as flood control and
7 recreation. But it's important that the
8 environmental studies of the relicensing process be
9 tightly and strictly focused within the project
10 boundary. The relicensing program should recognize
11 and work as a complement to the existing programs in
12 the state of California.

13 Thank you for considering our comments, not
14 only on behalf of Zone 7, but on behalf of the state
15 of California. Thank you.

16 MS. KROEN: Tim Quinn. Tim Quinn?

17 Okay. Wilson Head.

18 MR. HEAD: I'm Wilson Head. I'm an operations
19 engineer with the California Independent System
20 Operator. On a daily basis, I provide engineering
21 support to the realtime operation of the electric
22 transmission system of northern California, including
23 that of the Oroville complex, commonly referred to as
24 Hyatt-Thermalito. I'm also a member of the
25 Sacramento Valley Study Group whose main purpose is

1 to identify and encourage operating practices that
2 will ensure reliable electric transmission system
3 operation in the Sacramento Valley.

4 The ISO recognizes Hyatt-Thermalito as a
5 significant contributor to the overall supply
6 reliability of electricity and has a very important
7 role in the daily operations of the electric
8 transmission system.

9 Please bear in mind that the ISO-controlled
10 grids are a part of a vast interconnected system,
11 including electrical ties to the west of the western
12 United States and Canada as well as ties to the
13 hydroelectric pump generating plant at
14 Hyatt-Thermalito.

15 Undoubtedly, significant operational
16 difficulties presently exist within the
17 ISO-controlled grid. These difficulties are the
18 effects -- are due to the effects of insufficient
19 generating capacity throughout the state and other
20 grid reliability concerns such as voltage stability
21 and equipment overloads. The complex helps the ISO
22 manage these kinds of problems on a daily basis.

23 I just learned today that the complex is
24 licensed for just over 716 megawatts, but I also
25 understand that it can generate more than 900

1 megawatts, representing a substantial contribution to
2 the electrical supply reliability throughout
3 California. This magnitude of power is capable of
4 serving well over 500,000 households, businesses and
5 public facilities. Without the generating resources
6 contributed by the complex, California is
7 considerably more vulnerable to any additional supply
8 shortages.

9 Generating facilities at Hyatt-Thermalito have
10 also provided the ISO a variety of ancillary services
11 required to operate the grid reliably. Those
12 services include frequency regulation, very
13 important; voltage support, equally important;
14 operating reserve capacity and supplemental energy.

15 The hydroelectric complex is an especially
16 unique and invaluable resource that is capable of
17 fast response to electric demand changes. And
18 furthermore, it's capable of recycling its energy by
19 pumping water back upstream to improve operational
20 flexibility and provide generation capacity during
21 times of high power demand.

22 So the ISO looks forward to undiminished
23 generating capacity during the FERC relicensing
24 process and -- both for the energy it supplies to
25 California and the additional reliability it provides

1 to the ISO grid.

2 Upon relicensing, the pump generator complex
3 would be counted upon to continue to help mitigate
4 these electric system operational issues and remain
5 standing as a basic infrastructure element for
6 reliable Northern California electric system.

7 Thank you.

8 MS. KROEN: Don Marquez.

9 MR. MARQUEZ: Thank you, Patti.

10 My name is Don Marquez, Senior Engineer with
11 the Kern County Water Agency, and I'm going to be
12 delivering comments for our General Manager Thomas
13 Clark.

14 The Kern County Water Agency is the largest
15 agricultural State Water Project contractor and the
16 third largest municipal and industrial State Water
17 Project contractor. We have a total contract annual
18 entitlement from the state of California for
19 1 million -- approximately 1.1 million acre-feet.

20 Under the terms of the Agency's water supply
21 contract with the state, the Agency is responsible
22 for repaying with interest its allocated share of the
23 costs for developing and delivering State Water
24 Project supplies. The Agency's initial bill for 2002
25 water delivery totals approximately \$73 million. And

1 through the end of 2000, during the last 34 years,
2 the Agency has repayed more than \$1 billion of the
3 State Water Project costs.

4 We provide water service to over 600,000 acres
5 of farmland and about one-third of the homes and
6 businesses in the metropolitan Bakersfield area.

7 Operational changes that result in reducing
8 power generation capability and flexibility result in
9 increased water costs to the Agency and ultimately to
10 our landowners and other ratepayers. Of equal or
11 greater concern to the Agency and the other
12 contractors is the possibility that operational
13 changes will erode our water supply.

14 California is on the verge of a water supply
15 crisis that may well dwarf California's current
16 energy crisis. During the last two years, under
17 current regulatory conditions, the Agency's annual
18 water allocation was reduced by 10 and 61 percent,
19 respectively. It is inconceivable that any potential
20 operational change would justify further reducing the
21 water supply yield from the Oroville facilities.

22 I think that pretty much summarizes our --
23 most of our comments. We may submit some additional
24 comments before the deadline. Thank you.

25 MS. KROEN: Thank you, Don.

1 Lisa Wolfe.

2 MS. WOLFE: Good afternoon. My name is Lisa
3 Wolfe. I am a staff counsel with the State
4 Electricity Oversight Board.

5 The California Electricity Oversight Board was
6 created back in 1996 as a part of the Electric
7 Industry Restructuring Legislation. Our statutory
8 responsibility includes oversight of the California
9 Independent System Operator, also known as the ISO.
10 Of course, the ISO is charged with managing the
11 state's power grid and it also runs realtime markets
12 for energy and for ancillary services.

13 The California Electric Oversight Board takes
14 this opportunity to express its opinion regarding the
15 electrical value of continued operation of the
16 Oroville facilities. The Department of Water
17 Resources operates the Oroville facilities as part of
18 the State Water Project. Although the State Water
19 Project is essentially a net user of energy, it is
20 operated in a manner to maximize its on-peak
21 generation and its off-peak water pumping. This
22 allows for the Department of Water Resources to
23 market surplus generation.

24 Essentially, DWR enters into a variety of
25 bilateral agreements and arrangements to market the

1 surplus on-peak as well as off-peak generation from
2 the SWP for the State Water Project power system.
3 This includes the Oroville facilities.

4 DWR sells the surplus energy to the ISO and to
5 the energy purchasing arm of the DWR. Also, the
6 Oroville facilities contribute to the ancillary
7 services that the Department of Water Resources sells
8 into the ISO's ancillary services market, and,
9 pursuant to contractual arrangements, SCE receives a
10 portion of the ancillary services that are provided
11 by the Oroville facilities.

12 Overall, the EOB underscores the important and
13 significant electric contribution of the Oroville
14 facilities, including the provision of needed
15 ancillary services that maintain grid reliability.

16 Thank you.

17 MS. KROEN: Tim Quinn?

18 Ken, are you going to pinch hit?

19 MR. KULES: My name is not Tim Quinn. My name
20 is Ken Kules, and that's spelled K-u-l-e-s. It's a
21 good Russian name.

22 I won't reiterate some of the remarks that
23 were made earlier. I do have Tim's written remarks
24 that I'll turn in. But what I do want to do is focus
25 on -- mention a couple of things -- several things.

1 One, I do want to point out again the remarks
2 of the last commentor that pointed out the fact that
3 the project operates to provide peak power to the
4 state of California, and the project -- the State
5 Water Project as a user emphasizes its use of power
6 off peak. And we believe that to be very important.

7 I would also like to sort of chime in on the
8 comments related to CalFed. We strongly believe that
9 it would be highly inappropriate for the process to
10 second guess the measures and level of protection for
11 the environment developed through the CalFed process.

12 Lastly, I'd like to talk a little bit about
13 Southern California. With regard to the water supply
14 issues, the CalFed process has strongly emphasized
15 development of local resources and other innovative
16 management approaches to meet growing demands for
17 water in California. Nowhere has this mandate been
18 more fully implemented than in Southern California
19 where we are planning billions of dollars in
20 investment in reclamation, conservation, water
21 transfers, south of Delta storage and other measures
22 to reduce the demands for State Water Project in
23 normal and critically dry years.

24 The fact is that in Southern California, we're
25 not trying to rely on supplies from Oroville

1 Reservoir to meet growing demands for water. While
2 the reliability of existing State Water Project
3 supplies is critical for the regional economy,
4 additional supplies from Oroville are not part of our
5 plans to meet Southern California's future water
6 supply needs. We respectfully request that this
7 fundamental fact be recognized as this process moves
8 forward.

9 Thank you very much for this opportunity to
10 express Tim Quinn's views and Metropolitan Water
11 District's regarding this important proceeding.
12 Thank you.

13 MS. KROEN: Thanks, Ken.

14 Anyone else in the audience that would care to
15 provide comments at this time?

16 Okay. I see it's about 3:20 by my not very
17 accurate watch. I think the folks of the process
18 will hang around. And I'd like to give Rick an
19 opportunity to provide some final comments here.

20 MR. RAMIREZ: Okay. Well, thank you. That
21 essentially concludes our formal presentation. I
22 think we've heard some interesting comments over the
23 last 30, 40 minutes that really is going to be an
24 important element of the relicensing process. So I
25 would like to thank the commentators for taking the

1 time and making the effort to get that on the record.
2 I think that will be very helpful in the overall
3 decision-making process.

4 With that, I, again, will reiterate Patti's
5 comment. For those folks that may need additional
6 information, we will have relicensing staff and
7 consultants available for a few more minutes if you
8 would like to talk to us off line. And, again, thank
9 you very much, and please have a safe drive home.

10 (The hearing was concluded at 3:22 p.m.)

STATE OF CALIFORNIA)
) SS.
COUNTY OF SACRAMENTO)

I, SANDY HOPPER, a certified shorthand
reporter, do hereby certify that the foregoing 58
pages comprise a full, true and correct transcription
of the proceedings had and the testimony taken at the
hearing in the hereinbefore-entitled matter.

Dated this 22nd day of November, 2001, at
Sacramento, California.

_____

SANDY HOPPER, C.S.R.

C.S.R. NO. 7110
